

ELECTRICAL BOX FILTER INSTALLATION

The electrical box filter assembly will help protect the electrical components in your Mobius Trimmer M108. The filter mesh should be checked **before every trim session**.

STEP 01.

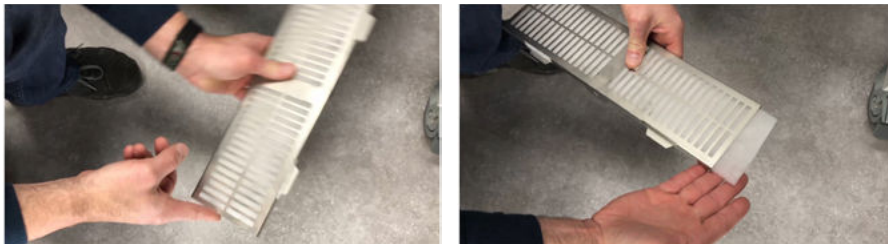

The assembly is comprised of two components. The metal piece is the filter holder. The white strip is the actual filter material, or filter mesh.

STEP 02.

Start by tucking the filter mesh strip into the filter holder. Work your way around the edges until the filter mesh is seated flat against the grate of the filter holder.

STEP 03.

The left side of the filter holder and filter mesh should be flush, while the right side will have a small strip sticking out.

STEP 04.

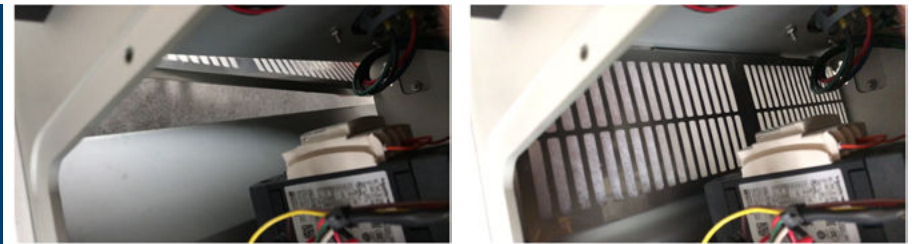

Before installing the filter, make sure the M108 is unplugged. Then simply push the filter assembly up into the electrical box air intake located just below the power plug. There are no tools required.

STEP 05.

The filter assembly should just snap into place. Tuck the loose end of filter mesh into the corner above the bolts.

STEP 06.

We've removed the side panel from this unit so in this view, you can see what it looks like from inside.

The life of the filter depends on machine usage and environment.
Check it before every trim session, and replace when needed.
